DETAILED ACTION

This office action follows a preliminary amendment in which claims 2-10 were amended.

Page 2

Election/Restrictions

1. Applicant's election with traverse of group I, claims 1-7 in Paper No. 7 is acknowledged.

The traversal is on the ground(s) that if group I is found novel and unobvious, then groups II and

III must also be novel and unobvious. This is not found persuasive because inventions I and III

were deemed unrelated. Furthermore, inventions I and II, although related as mutually exclusive

species, were shown to be distinct entities (See Paper No. 5).

The requirement is still deemed proper and is therefore made FINAL.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claim 3 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing

to particularly point out and distinctly claim the subject matter which Applicant regards as the

invention. The claim recites the terms "metallocene catalyzed polyolefins" and "synthetic block

copolymer rubbers," of which there are innumerable types. Without qualification, the claim

remains vague and ambiguous.

Application/Control Number: 09/636,781 Page 3

Art Unit: 1713

4. Claims 6 and 7 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite

for failing to particularly point out and distinctly claim the subject matter which applicant

regards as the invention. The phrase "particularly" renders the claim indefinite because it is

unclear whether the limitation(s) following the phrase are part of the claimed invention. See

MPEP § 2173.05(d).

5. Claims 6 and 7 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite

since it contains improper Markush language. According to MPEP 2173.05(h), when materials

are so related as to constitute a proper Markush group, they may be recited as, "wherein R is a

material selected from the group consisting of A, B, C, and D," or "wherein R is A, B, C, or D."

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the

basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on

sale in this country, more than one year prior to the date of application for patent in the United States.

7. Claims 1, 2 and 5 are rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Patent

No. 4,021,391 to Ijichi et al.

Ijichi et al. discloses a pressure sensitive adhesive (PSA) comprising a non-thermoplastic

elastomer, 0.75-1.2 equivalents of a polyfunctional isocyanate, and 10-70 parts by weight of a

tackifier (claim 1). The elastomer is a hompolymer of a diene monomer selected from butadiene.

isoprene, and chlorprene (claim 8). A catalyst can be used to accelerate the reaction between polymer and isocyanate (col. 6, line 1).

Page 4

8. Claims 1-3 and 6 are rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Patent No. 5,760,135 to Korpman et al.

Korpman et al. discloses a PSA composition comprising a mixture of a solid rubber and a liquid rubber. The non-thermoplastic elastomer component is selected from isoprene, butadienestyrene, butadiene, inter alia (claim 1), a polyisocyanate compound as the crosslinking agent (claim 6), and 3-20 % by weight of a tackifier resin (claim 10). The thermoplastic elastomer component may consist of block copolymers (col. 3, line 20). The composition may also include fillers such as zinc oxide, titanium oxide, and carbon black (col. 5, lines 3-4).

9. Claims 1 and 2 are rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Patent No. 3,932,558 to Kest *et al.*

Kest et al. teaches a composition comprising a liquid diene telechelic polymer material selected from the group comprising styrene terminally located rubber, polyisoprene, polychloroprene, and random copolymers of styrene and butadiene, a polyisocyanate component, and a resin material in the amount of 100-200 parts by weight (claims 1, 6, and 9).

10. Claims 1 and 2 are rejected under 35 U.S.C. 102(b) as being anticipated by JP 58-7471.

The cited reference discloses an adhesive composition comprising (A) a liquid rubber such as polybutadiene, (B) 10-1000 parts of a tackifying resin, and (C) a polyisocyanate crosslinking component.

11. Claims 1, 2 and 7 are rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Patent No. 4,204,046 to Minatono *et al.*

Minatono *et al.* teaches a PSA composition comprising a liquid rubber, *i.e.*, polyisoprene (claim 1), a polyisocyanate crosslinking agent (claim 9), and 0.1-200 parts by weight of tackifier (claim 11). Compositions of the invention may include naphthenic oil as a plasticizer (Table 5).

Claim Rejections - 35 USC § 103

- 12. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 13. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 - 1. Determining the scope and contents of the prior art.
 - 2. Ascertaining the differences between the prior art and the claims at issue.
 - 3. Resolving the level of ordinary skill in the pertinent art.
 - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Art Unit: 1713

14. Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 5,760,135 to Korpman et al. in view of U.S. Patent No. 3,956,223 to Chiang et al.

The discussion of the disclosures of the prior art of Korpman et al. from paragraph 8 of this office action is incorporated here by reference. The reference does not teach the use of plasticizing oils specifically, although the use of "oils" is contemplated (col. 4, line 64). The use of oils in such compositions is well-established in the art. For example, Chiang et al. show that naphthenic process oils are useful for building up the softness of the tack and to adjust flow properties and plasticity of pressure sensitive adhesives. In view of the references, it would have been obvious to one having ordinary skill in the art to use this particular material in the composition of Korpman et al., and one would have expected such an modification to produce a useful pressure sensitive adhesive.

15. Claims 1, 2, and 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 5,204,409 to Arend et al. in view of Ijichi et al.

Arend et al. teaches the use of polyisocyanates as crosslinking agents for polymeric adhesives selected from the group consisting of natural and synthetic rubbers (claims 1-6). The inventors contemplate the use of natural resins, modified natural resins, or synthetic resins to modify adhesive properties, for example, to obtain particularly long-lasting contact tackiness or to increase cohesive strength (col. 2, lines 42-50). The reference does not state the identity or amount of such materials. Ijichi et al. indicates that 10-70 parts by weight of tackifiers are suitable for such a purpose, and several examples of tackifiers are described within the text. Regarding claim 1, one having ordinary skill in the art would have found it obvious to

Art Unit: 1713

incorporate the tackifier resins of Ijichi et al. into the composition of Arend et al. because such an embodiment is strongly suggested. One having skill in the art would have composed an adhesive containing natural or synthetic rubbers, polybutadienes or polyisoprenes because these materials are used in the prior art. It would also be obvious to use a catalyst to accelerate crosslinking since this is also taught in the prior art.

16. Claims 1-3, 5 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 3,860,673 to Lawrence.

Lawrence discloses an elastomeric composition, useful as an adhesive, comprising a synthetic or naturally occurring elastomer, an organic polyisocyanate, and a catalyst (claim 1). The use of a tackifying resin such as wood rosin and terpene-phenolic resin is contemplated (col. 4, lines 9-11). In Example 1, the composition is found to contain 25 parts of tackifying resin component. Elastomers include natural rubber and styrene-butadiene rubber (col. 1, lines 52-53). Further elastomers which may be employed include copolymers of ethylene and propylene, terpolymers of ethylene, propylene, and diene, and polyurethanes (col. 1, line 59-62). Moreover, blends of elastomers may be employed (col. 1, line 58). Other components include zinc oxide and magnesium oxide (col. 4, line 8). Although no single embodiment that encompasses all the claims are shown in the examples, it would have been obvious to one having ordinary skill in the art to arrive at the claims of the present invention because all aforementioned elements lie within the generic disclosure of the reference. It would be obvious to make a pressure sensitive adhesive using a blend of elastomers because this is also contemplated in the prior art.

Application/Control Number: 09/636,781

Art Unit: 1713

17. Claim 4 is objected to as being dependent upon a rejected base claim, but would be

allowable if rewritten in independent form including all of the limitations of the base claim and

any intervening claims.

18. The prior art made of record but not relied upon is considered pertinent to the Applicant's

The following references relate to polyisocyanate crosslinked elastomeric PSA disclosure.

materials.
